## Vulnerability

<b>Vulnerability Name</b>	MS-2024-Jan: .NET, .NET Framework, and Visual Studio Security Feature Bypass Vulnerability	<b>Score</b>	52
<b>Published</b>	2024-01-09	<b>Strategy</b>	Data-Driven Attack
<b>CVSS v3</b>	nCircle: 600796 9.8	<b>CVSS v2</b>	4.0

## Description

### DESCRIPTION

Microsoft .NET Framework is subject to a security feature bypass vulnerability. A remote attacker could bypass security checks upon successful exploitation of this vulnerability.

### SOLUTION

The vendor has released patches for this vulnerability. Please refer to the advisory links below.

## Affected Applications

### Application Name

.NET Core Runtime

Microsoft .NET Framework v2.x

Microsoft .NET Framework v3.0

Microsoft .NET Framework v3.5

Microsoft .NET Framework v4.7.x

Microsoft .NET Framework v4.8.1

Microsoft .NET Framework v4.8.x

Microsoft Visual Studio 2019

Microsoft Visual Studio 2022

PowerShell Core

Windows Registry

## Description

### DESCRIPTION

Microsoft .NET Framework and Microsoft SQL Server is subject to a security feature bypass vulnerability. A local attacker could bypass security checks upon successful exploitation of this vulnerability.

### SOLUTION

The vendor has released patches for this vulnerability. Please refer to the advisory links below.

## Affected Applications

### Application Name

.NET Core Runtime

Microsoft .NET Framework v2.x

Microsoft .NET Framework v3.5

Microsoft .NET Framework v4.7.x

Microsoft .NET Framework v4.8.1

Microsoft .NET Framework v4.8.x

Microsoft SQL Server 2022

Microsoft Visual Studio 2022

Windows Registry

<b>Published</b>	nCircle: 11144	<b>Strategy</b>	Network Reconnaissance
<b>CVSS v3</b>	0.0	<b>CVSS v2</b>	0.0

## Description

### DESCRIPTION

A folder that grants read access to Everyone is accessible through an SMB share.

### SOLUTION

The effective permissions of an SMB share are determined by the most restrictive result of the SMB permissions and the underlying file system permissions. Ensure shared folders have a secure access control list.

## Affected Applications

### Application Name

SMB-Auth

<b>CVSS v3</b>	nCircle: 27350 0.0	<b>CVSS v2</b>	0.0

## Description

### DESCRIPTION

The Microsoft Remote Desktop Service was detected on the server.

The Microsoft Remote Desktop Service (formerly known as Terminal Service) provides remote display and input capabilities over network connections for Windows-based applications running on a server. RDP is designed to support different types of network topologies and multiple LAN protocols. By default the server listens on TCP port 3389.

### SOLUTION

Disable this service if it is not essential to the server's operation.

## Affected Applications

### Application Name

Microsoft Remote Desktop Protocol

<b>Published</b>		<b>Strategy</b>	Network Reconnaissance
<b>CVSS v3</b>	nCircle: 28951 0.0	<b>CVSS v2</b>	0.0

## Description

### DESCRIPTION

By sending a NetBIOS query, an attacker may be able to detect all IP Addresses on a system, not just the public IP Address. This may disclose internal network information.

### SOLUTION

Restrict access within a broadcast domain to trusted hosts only.

## Affected Applications

### Application Name

NetBIOS Name Service

<b>Published</b>		<b>Strategy</b>	Network Reconnaissance
<b>CVSS v3</b>	nCircle: 1225 0.0	<b>CVSS v2</b>	0.0

## Description

### DESCRIPTION

DCE is Microsoft's implementation of the RPC protocol.

Microsoft uses DCE in the same manner that Unix uses portmap. This service is used to register other services with a central control program that facilitates distributed computing.

This service can be used by an attacker to determine the name, version, and location of any DCOM or RPC service on the machine.

## Affected Applications

### Application Name

DCE/MS RPC over TCP

<b>Vulnerability Name</b>	CredSSP "AllowEncryptionOracle" Policy Setting: Mitigated Mode	<b>Score</b>	0
<b>Published</b>	nCircle: 385173	<b>Strategy</b>	Network Reconnaissance
<b>CVSS v3</b>	0.0	<b>CVSS v2</b>	0.0

## Description

### DESCRIPTION

The system has the AllowEncryptionOracle policy set to Mitigated mode. Client applications that use CredSSP will not be able to fall back to insecure versions, but services that use CredSSP will accept unpatched clients.

### SOLUTION

This exposure is for informational purposes only. For more information about the AllowEncryptionOracle policy modes refer to Microsoft's KB4093492.

## Affected Applications

### Application Name

Windows Registry

## Description

### DESCRIPTION

The ms-msdt protocol scheme is configured on this system. This protocol scheme has been associated with the Follina vulnerability allowing for remote code execution within Microsoft Office.

### SOLUTION

Protocol Schemes can be deleted from the registry (HKCR) to remove the association.

## Affected Applications

## Description

### DESCRIPTION

The search-ms protocol scheme is configured on this system. This protocol scheme can allow an attacker to open an Explorer window which points at a remote share with a custom display name, potentially allowing the end user to be social engineered.

### SOLUTION

Protocol Schemes can be deleted from the registry (HKCR) to remove the association.

<b>Published</b>	nCircle: 530548	<b>Strategy</b>	Data-Driven Attack
<b>CVSS v3</b>	0.0	<b>CVSS v2</b>	0.0

## Description

### DESCRIPTION

A vulnerability exists due to the way in which the CreateProcess function creates new processes. When a process path contains spaces, the CreateProcess function attempts to execute a process at each point where a spaces occurs. For example, in the path C:\Program Files\Tripwire Demo\example.exe, the CreateProcess function will attempt to execute C:\Program.exe and C:\Program Files\Tripwire.exe before trying C:\Program Files\Tripwire Demo\example.exe.

This vulnerability can be exploited when services do not properly enclose paths with spaces within quotes.

### SOLUTION

Ensure that all executable service paths are wrapped in quotes.

## Affected Applications

### Application Name

Windows Registry

<b>Published</b>	2024-07-09 nCircle: 644468	<b>Strategy</b>	Data-Driven Attack
<b>CVSS v3</b>	7.5	<b>CVSS v2</b>	2.4

## Description

### DESCRIPTION

Windows Cryptographic Services are subject to a security feature bypass vulnerability. A local attacker could bypass digital signatures upon successful exploitation of this vulnerability. Successful exploitation requires the attacker to create a SHA1 has collision.

### SOLUTION

The vendor has released patches for this vulnerability. Please refer to the advisory links below.

The patch alone does not resolve this vulnerability. The registry key HKLM\SOFTWARE\Microsoft\Cryptography\Calais\DisableCapiOverrideForRSA must also be set to 1.

## Affected Applications

### Application Name

Microsoft Cryptographic Services

<b>Published</b>		<b>Strategy</b>	Access Control Breach
<b>CVSS v3</b>	nCircle: 1492 0.0	<b>CVSS v2</b>	0.0

## Description

### DESCRIPTION

The NetBIOS session service (netbios-ssn, tcp 139) serves as a connection-oriented, reliable, sequenced transport mechanism for NetBIOS messages.

The Windows NetBIOS implementation is designed for ease-of-use with regard to network resource sharing. Windows NT/2K allows a substantial amount of information to be obtained about the network by querying NetBIOS services. There are several severe information leaks associated with default configuration of Windows NT: anonymous domain and user enumeration, share access, and remote acquisition of Registry information (a.k.a. the "Red Button" attack).

### SOLUTION

We recommend the use of packet filtering on firewalls and border routers to block access to NetBIOS services of internal systems. On systems that are exposed to the Internet, entirely disable the following NetBIOS services over TCP/IP:

NetBIOS Name Service, 137/tcp and 137/udp  
 NetBIOS Datagram Service, 138/tcp and 138/udp  
 NetBIOS Session Service, 139/tcp and 139/udp

## Affected Applications

### Application Name

Microsoft Windows NetBIOS Session Service  
 NetBIOS Session Service  
 Samba NBSS
