Framework, and Visual Stu-

dio Security Feature Bypass

Vulnerability

Published 2024-01-09 Strategy Data-Driven Attack

Description

DESCRIPTION

Microsoft .NET Framework is subject to a security feature bypass vulnerability. A remote attacker could bypass security checks upon successful exploitation of this vulnerability.

SOLUTION

The vendor has released patches for this vulnerability. Please refer to the advisory links below.

Affected Applications

Application Name

.NET Core Runtime

Microsoft .NET Framework v2.x

Microsoft .NET Framework v3.0

Microsoft .NET Framework v3.5

Microsoft .NET Framework v4.7.x

Microsoft .NET Framework v4.8.1

Microsoft .NET Framework v4.8.x

Microsoft Visual Studio 2019

Microsoft Visual Studio 2022

PowerShell Core

Windows Registry

CVSS v3 7.5

Description

DESCRIPTION

Microsoft .NET Framework is subject to a denial of service vulnerability. An attacker could cause a denial of service condition upon successful exploitation of this vulnerability.

SOLUTION

The vendor has released patches for this vulnerability. Please refer to the advisory links below.

Description

DESCRIPTION

The Microsoft Remote Desktop Service was detected on the server.

The Microsoft Remote Desktop Service (formerly known as Terminal Service) provides remote display and input capabilities over network connections for Windows-based applications running on a server. RDP is designed to support different types of network topologies and multiple LAN protocols. By default the server listens on TCP port 3389. SOLUTION

Disable this service if it is not essential to the server's operation.

Unquoted Service Path Weakness

Score Strategy CVSS v2

Data-Driven Attack

nCircle: 530548

CVSS v3 0.0

0.0

Description

DESCRIPTION

A vulnerability exists due to the way in which the CreateProcess function creates new processes. When a process path contains spaces, the CreateProcess function attempts to execute a process at each point where a spaces occurs. For example, in the path C:\Program Files\Tripwire Demo\example.exe, the CreateProcess function will attempt to execute C:\Program.exe and C:\Program Files\Tripwire.exe before trying C:\Program Files\Tripwire Demo\example.exe.

This vulnerability can be exploited when services do not properly enclose paths with spaces within quotes. SOLUTION

Ensure that all executable service paths are wrapped in quotes.

CVSS v3 7.5

Description

DESCRIPTION

Microsoft .NET Framework is subject to a information disclosure vulnerability. A remote attacker could obtain the ObjRef URL resulting in RCE upon successful exploitation of this vulnerability. SOLUTION

The vendor has released patches for this vulnerability. Please refer to the advisory links below.

Affected Applications

Application Name

Microsoft .NET Framework v2.x

graphic Services Security Feature

Bypass Vulnerability

Published 2024-07-09

nCircle: 644468

CVSS v3 7.5 0

Data-Driven Attack Strategy

CVSS v2 2.4

Description

DESCRIPTION

Windows Cryptographic Services are subject to a security feature bypass vulnerability. A local attacker could bypass digital signatures upon successful exploitation of this vulnerability. Successful exploitation requires the attacker to create a SHA1 has collision.

SOLUTION

The vendor has released patches for this vulnerability. Please refer to the advisory links below.

The patch alone does not resolve this vulnerability. The registry key $HKLM \setminus SOFTWARE \setminus Microsoft \setminus Cryptography \setminus Calais \setminus Disable Capi Override For RSA \ must \ also \ be \ set \ to \ 1.$

DCE RPC mapper available

Score Strategy

Network Reconnaissance

CVSS v2 0.0

CVSS v3

nCircle: 1225 0.0

Description

DESCRIPTION

DCE is Microsoft's implementation of the RPC protocol.

Microsoft uses DCE in the same manner that Unix uses portmap. This service is used to register other services with a central control program that facilitates distributed computing.

This service can be used by an attacker to determine the name, version, and location of any DCOM or RPC service on the machine.

Affected Applications

Application Name

DCE/MS RPC over TCP

Vulnerability Name Published

NetBIOS SSN Available

Score Strategy CVSS v2

Access Control Breach

0.0

nCircle: 1492

CVSS v3 0.0

Description

DESCRIPTION

The NetBIOS session service (netBIOS-ssn, tcp 139) serves as a connection-oriented, reliable, sequenced transport mechanism for NetBIOS messages.

The Windows NetBIOS implementation is designed for ease-of-use with regard to network resource sharing. Windows NT/2K allows a substantial amount of information to be obtained about the network by querying NetBIOS services. There are several severe information leaks associated with default configuration of Windows NT: anonymous domain and user enumeration, share access, and remote acquisition of Registry information (a.k.a. the "Red Button" attack). SOLUTION

We recommend the use of packet filtering on firewalls and border routers to block access to NetBIOS services of internal systems. On systems that are exposed to the Internet, entirely disable the following NetBIOS services over TCP/IP:

NetBIOS Name Service, 137/tcp and 137/udp

NetBIOS Datagram Service, 138/tcp and 138/udp

NetBIOS Session Service, 139/tcp and 139/udp

Affected Applications

Application Name

Microsoft Windows NetBIOS Session Service
